MQAC[redacted]SE MANAGEMENT TEAM ASSES[redacted]MENT

Wednesday CMT – Telephonic Assessment

Respondent: Medical Unknown **Case Number:** 2011-153821

Date: 4-27-11	Staff Attorney: Mager	Clerk: Newman
Panel Chair:	Cullen, Andison, Brantner, Burger, Clower, Concannon, Elders, Green, Johnson, Pattison, Tobin, Dore, Gothold, Harder, Harvey, Hensley, Hopkins, Page, Robins, Ruiz, Sen	
Staff Present:: ED, ISU, PM, Staff Atty, Disc Mgr, Other	Jansen, Dr. Heye, Smith, Newman, Kramer, Creighton, Farrell, Berg, Caille, McLaughlin, Landreau, Mager	

A. FILE CLOSED PRIOR INVESTIGATION (BEFORE)

☐ **BT1** - Advertising that is a technical violation	☐ **BT7** - Insufficient information	☐ **BT12** - Profession-Specific Threshold Explain:_____ a) Violating confidentiality b) Inappropriate delegation to unlicensed person that does not involve invasive procedures or piercing of skin (e.g., RN instructs NA to apply skin cream) c) Failure to supervise resulting in no harm or minor harm to a patient d) Isolated incidents which suggest little or no patient harm, not likely to reoccur
☐ **BT2** - Aged or outdated complaints	☐ **BT8** - Issues which have been otherwise resolved. Explain resolution:_____ (Detail corrective action: practitioner is already revoked; ongoing monitoring, etc.)	☐ **BT13** - Referral to another program or agency
☐ **BT3** - Billing and fee disputes except as designated by disciplining authority	☐ **BT9** - Lack of complaint credibility	☐ **BT14** - Risk minimal, not likely to reoccur
☐ **BT4** - Communication and personality issues	☐ **BT10** - No Jurisdiction	☐ **BT15** – Time practice on an expired credential for a period of time accepted by the disciplining authority
☐ **BT5** - Complainant withdrew	☐ **BT11** - No violation at the time the event occurred	☐ **BT16** – Unidentified complainant, client or patient name and no allegations of significant harm or potential harm
☐ **BT6** - If allegations are true, no violation of law occurred		Further explanation (if any):

B. SCOPE OF INVESTIGATION AUTHORIZED: ☐ Entire complaint ☐ Limit investigation ☐ Focus investigation

Notes: _____

C. PRIORITY ☐ A (risk of immediate danger) ☐ B (serious risk) ☐ C (moderate risk ☐ D (minor risk) ☐ E (technical violations)

D. SEXUAL MISCONDUCT CASES: Refer complaints of sexual misconduct to the Secretary when the case does not involve clinical expertise or standard of care issues. (*If the panel cannot tell if clinical issues exist, the panel may request the investigator contact the complainant or key witness)*

☐ Panel finds there are clinical issues, do not refer ☐ No clinical issues, refer case to Secretary ☐ Contact complainant or witness for more Info

E. CLOSED AFTER INVESTIGATION

☐ Application investigation only - Panel decides to grant without conditions	
☐ A1-Care rendered was within standard of care	☐ A7-Mistaken identity
☐ A2-Complainant withdrew-	☐ A8-No Jurisdiction
☐ A3- Unique closure (panel must explain)	☐ A11-No Whistleblower
☐ A5- Evidence does not support a violation	☒ **A12**-Risk minimal, not likely to reoccur
Further Explanation:	

MQAC CMT Assessment (yellow) mlf 0812—2010
04/13/11

GUIDE FOR CLOSURE CODES

June 2010

Code	Closure	Description
	Application	Decision to grant an unrestricted license.
A-1	Care rendered was within standard of care	The evidence establishes that the respondent met or exceeded the standard of care.
A-2	Complainant withdrew complaint	The complainant withdrew the complaint, and the complainant's testimony is necessary to meet the burden of proof.
A-3	Unique closure (Panel must explain)	Any concerns regarding Respondent have been resolved through corrective action, license revocation, suspension, or other means. • Respondent died. • Other circumstances (explain): _____ _____ _____
A-5	Evidence does not support a violation	• Cannot establish by clear, cogent, and convincing evidence that Respondent violated any UDA provision. • Includes situations where the investigator was unable to obtain all material evidence. • Despite the evidence, the alleged misconduct does not constitute a UDA violation.
A-7	Mistaken Identity	Case opened under the wrong respondent's name.
A-8	No Jurisdiction	Respondent is not licensed in Washington, has never been licensed in Washington, and is not applying for a license in Washington.
A-11	No Whistleblower Release	Complainant would not sign a whistleblower release AND the complainant's identity is necessary to prove a UDA violation.
A-12	Risk Minimal- Not likely to Reoccur	There is sufficient evidence that Respondent violated the UDA, but the evidence indicates that (a) the violation is not likely to reoccur and (b) closure poses no more than a minimal risk to the public.

POST INVESTIGATION REVIEW
Case Number: 2011-153821

***Date: 4-14-2011**

Date: February 14, 2011
Presented by: **George Heye, MD**

Respondent:	**MEDICAL, UNKNOWN**	**Grays Harbor County**

Complainant:	**Ron and Valerie Foulds, Jr.**

CASE SUMMARY

The Respondent:

Board Certified:	Unknown
DOB:	Unknown
Licensed since:	Unknown
Expiration date:	Unknown
Medical School:	Unknown
Residency:	Unknown

The Complainant: The son and daughter-in-law of a patient

The Complaint: The complainants think that the 90 y/o father received a medication not prescribed for him which caused him to become unresponsive and hypotensive. He was treated at a local hospital where he reportedly tested positive for narcotics which are not part of his normal medication regimen.

***Post Investigation Review: 4-14-2011**

A 90y/o nursing home resident who was usually mentally alert was found just before midnight to be obtunded and with shallow respirations. 911 was called and the patient responded briefly to Narcan. The patient was taken to a local hospital where he received additional Narcan and was admitted. The patient required intubation and blood pressure support. He remained on the ventilator for a day and a half and then maintained well without it. The patient reportedly grew MRSA staph from his urine and was treated with antibiotics. He was discharged back to the nursing home on day five but his mental clarity was still variable.

A urine test on admission was positive for oxycodone. A repeat test was also positive. The patient was not on any narcotic medication at the nursing home. An extensive investigation at the nursing home failed to turn up any missing medication or any explanation for the oxycodone in the patient's urine. There was some speculation that the patient's symptoms could be explained by the UTI but this would not account for the positive urine test. In addition both the EMT provider and the ER personnel noted that on presentation the patient had pin point pupils. Finally I could find no evidence that Narcan [naloxone] causes a positive opioid result on a urine test.

GENERAL CASE SUMMARY

COMPLAINT / ALLEGATIONS:

The complainants think that the 90 y/o father received a medication not prescribed for him which caused him to become unresponsive and hypotensive. He was treated at a local hospital where he reportedly tested positive for narcotics which are not part of his normal medication regimen.

CASE REVIEW:

On 03/16/11 the Complainant and his wife, Valerie Foulds were interviewed **(Pages 5-6).** They visit his father, 2 - Healthcare Information Readily Ide... ., at the Montesano Health and Rehabilitation Center (MHRC) at least 2-3 times per week. Mr. 2 - Healthcare I... has lived there for 4 years. He married a female resident in that time period. They are "very involved" in Mr. 2 - Healthcare Inf... care.

His father is described as mentally alert and wheelchair bound because of two leg amputations.

On 02/08/11 the Complainant had taken his father to the dining room between 12:00 and 1:00. A "nurse" described as 50-60 years of age with "shoulder length gray hair" came to his father with two cups of pills in applesauce in her hand. She'd said, "Mr. 2 - Healthca... , I have your new medication."

That nurse gave one cup to Mr. 2 - Healthcare Infor... and one to his wife. The Complainant does not know what was in the cup. He came home and asked his wife if anyone had called about a new medication and she said they hadn't. The facility was in the habit of "always informing" them if his father was to be prescribed any new meds, creams, etc. They'd heard nothing about a new medication.

The Complainant and his wife received a call from the hospital approximately 11PM that night. His father had been brought in by ambulance, unresponsive with dilated pupils. They were asked if his father was on any narcotics, and they said, "Absolutely not". Mr. 2 - Healthcare Inf... was on "numerous meds", but no narcotics.

They discovered the Montesano Fire Department had given Mr. 2 - Healthcare In... Narcan, to which " in 15 minutes he was responsive and talking". They had "met the ambulance at the hospital".

He was admitted that night at Gray's Harbor Community Hospital (GHCH) and discharged on 02/14/11 **(Pages)**. He tested positive for hydrocodone and a drug sample was also sent away for testing. Mr. 2 - Healthc... does not take hydrocodone and is not in the habit of taking other patients' medications at the rehab facility.

They kept a journal of the incident and agreed to send a copy of it along with the second page of their complaint **(Pages)**.

On 03/21/11 Kathy Stone, DNS for MHRC was interviewed **(Page 27).** She stated the NAC who gave Mr. 2 - Healthcare Info... his medication is Laurie Justice. She wears braces and has a bit of a speech impediment. She had been unable to give him his morning medication on 02/08/11 as he was still asleep. She found him in the lunchroom with his son. She has informed Mr. 2 - Healthcare Inf... that she was there with his "noon" medications, not "new" medications.

Ms. Stone had specifically asked her about this. Ms. Justice is willing to provide a statement to that effect. That statement is found on **Page 28**, which reiterates the aforementioned information on Mr. 2 - Health... "noon" medications.

Ms. Stone informed me that Mr. 2 - Healthcare Inf... had been given Narcan by the medics on 02/08/11 when he was found unresponsive and at the ER. No urine sample had been collected prior to the administration of that medication. Narcan can bring about false positive results. She also noted that Mr. 2 - Health... had been tested positive for marijuana at that hospital admission. This has caused her to question whether the hospital's lab test is accurate.

Mr. 2 - Healthcare Inf... is not prescribed any narcotics. Neither is his wife, Hilda, who had been given medication at the same time as her husband. She stated their narcotics log book had been reconciled for that day. She cannot think of a way that Mr. 2 - Healthcare In... could have gotten hold of any opiates. She had explained this to the Complainant.

Mr. 2 - Healthcare In... is still at their facility and is back to his baseline status.

Mr. 2 - Healthcare Infor... "Incident/Accident Report" is found on **Pages 30-33).** It reads, "Narcan administered will result in False +. Resident was septic upon admission and returned with diagnosis of MRSA in urine, which would have been indicative of decreased LOC. Although conclusion cannot positively state Oxycodone was or wasn't administered It is more than likely + was from Narcan 2) decreased LOC was from sepsis."

The MHRC records are found on **Pages 34-101.**

The Gray's Harbor Community Hospital (GHCH) records are found on **Pages 102-135.** The ED report reads, "He responded to Narcan initially and now has decreasing mental status." At the ED "the patient was started on a Narcan drip."

The assessment/plan reads, "Acute respiratory failure, obtunded encephalopathic, unable to protect airway. This could possibly be secondary to oxycodone toxicity. This, however, was not prescribed and it is unclear exactly how the patient could have received this. A repeat toxicology screen, however, was positive. It certainly could be a real ingestion. It could be a false positive. His condition could also be sepsis secondary to urinary tract infection or possibly pneumonia. Sepsis can occasionally improve with Narcan as well temporarily and his episode was also complicated by hypotension." He was admitted.

The Toxicology report is found on **Pages 129-130.** There are abnormal results on 02/12/11 for benzodiazepines, THC (Marijuana) and Oxycodone. A toxicology report from 02/09/11 indicates negative results for THC **(Page 62).**

The urine culture was positive for Staphylococcus Aureus **(Page 131).** The MRSA screen was negative, as well as the blood culture **(Pages 133-134).**

The hospitalist report reads, "Altered mental status, likely secondary to urinary tract infection." **(Pages 80-82)**

This investigation is completed and the case file forwarded to Program for review.

My father may have been given a medication that was not prescribed to him at the facility which caused him to be taken to the hospital on the night of 2/8. He was unresponsive when he arrived and his blood pressure started dropping. He was tested for narcotics which was positive. He is on no narcotics of any kind. He was given a drug called Narcam? which is for overdoses and was concious for only a few minutes. He was given this numerous times. He had to be resuscitated because his blood pressure had dropped to the extent that he was dead. He was

Subject: Your Case Against an Unknown Medical Doctor
Re: Case # 2010-153821

Dear Mr. and Mrs. Foulds, Jr.:

The Medical Quality Assurance Commission has completed its investigation of your complaint concerning an unknown medical doctor. The Commission is committed to protecting the health and safety of citizens of the state of Washington. The Commission takes every complaint seriously.

To take disciplinary action against a physician's license, the Commission is required to prove by clear and convincing evidence, a high burden of proof, that the medical treatment provided posed a risk to the public. After careful review of the information gathered during the investigation, the Commission determined that the risk to the public is minimal and not likely to reoccur. Based on this review, the Commission closed the case.

Thank you for bringing your concerns to the attention of the Medical Quality Assurance Commission.

Sincerely,

Mike Krauss
For

Dani Newman, Disciplinary Manager
Medical Quality Assurance Commission

NOTICE

WAC 246-15-030, procedures for filing, investigation, and resolution of whistleblower complaints.

(1)(b) Instructs that staff will affix a permanent cover to the letter of complaint or other form of notice in the complaint file, noting the statutory citation concerning protecting the identity of the complainant.

(3)(c) Ensure upon case closure, that the permanent cover affixed in subsection (1)(c) of this section will remain.

RCW 43.70 provides that the identity of a whistleblower who complains in good faith to the Department of health about the improper quality of care by a health care provider as defined in RCW 43.72.010 ***shall remain confidential***.

Pursuant to the above RCW and WAC it is staff's duty to see that the complainant's name or any information which may identify the complainant is not disclosed.

My father may have been given a medication that was not prescribed to him at the facility which caused him to be taken to the hospital on the night of 2/8. He was unresponsive when he arrived and his blood pressure started dropping. He was tested for narcotics which was positive. He is on no narcotics of any kind. He was given a drug called Narcam? which is for overdoses and was concoious for only a few minutes. He was given this numerous times. He had to be resuscitated because his blood pressure had dropped to the extent that he was dead. He was

revived and then ~~[illegible]~~ we were asked if we would ok a breathing tube. He has a DNR. order but we were told this would bring up his pressure. The doctor told us she would give him more of the (Narcan?) to revive him enough to ask him if that was ok. which she did and he would let them do it. He was stable after the tube was inserted. He also had a UTI. There are other things that also happened that are in his medical records at Grays Harbor Community Hospital. He was taken to CCU were he has been.

We would like this incident investigated He has been at Montesano Rehab for 4 years. We see him 2 to 3 times a week and are very involved in his life. He ~~[illegible]~~ was fine when I was there on the afternoon of this incident.

Please include additional sheets as necessary.

MEDICAL INVESTIGATIONS

MEMORANDUM TO FILE

DATE: 03/16/11

TIME: 08:10 AM

CASE #: 2011-153821MD

RE: Interview with Complainant and his wife Valerie

FROM: Connie Pyles, Health Care Investigator

The Complainant and his wife, Valerie Foulds, visit his father, 2 - Healthcare Information Read... Sr., at the Montesano Health and Rehabilitation Center at least 2-3 times per week. Mr. 2 - Healthcare In... has lived there for 4 years. He married a female resident in that time period. They are "very involved" in Mr. 2 - Healthcare Infor... care.

His father is described as mentally alert and wheelchair bound because of two leg amputations.

On 02/08/11 the Complainant had taken his father to the dining room between 12:00 and 1:00. A "nurse" described as 50-60 years of age with "shoulder length gray hair" came to his father with two cups of pills in applesauce in her hand. She'd said, "Mr. 2 - Healthc..., I have your new medication."

That nurse gave one cup to Mr. 2 - Healthcare Infor... and one to his wife. The Complainant does not know what was in the cup. He came home and asked his wife if anyone had called about a new medication and she said they hadn't. The facility was in the habit of "always informing" them if his father was to be prescribed any new meds, creams, etc. They'd heard nothing about a new medication.

The Complainant and his wife received a call from the hospital approximately 11PM that night. His father had been brought in by ambulance, unresponsive with dilated pupils. They were asked if his father was on any narcotics, and they said, "Absolutely not". Mr. 2 - Healthcare Inf... was on "numerous meds", but no narcotics.

They discovered the Montesano Fire Department had given Mr. 2 - Healthcare Inf... Narcan, to which " in 15 minutes he was responsive and talking". They had "met the ambulance at the hospital". The rehab facility did not send staff with their patient.

He was admitted that night at Gray's Harbor Community Hospital (GHCH) and discharged on 02/14/11. Four days were spent in the ICU. He tested positive for hydrocodone and a drug sample was also sent away for testing. Mr. 2 - Health... does not take hydrocodone and is not in the habit of taking other patients' medications at the rehab facility.

Mr. 2 - Healthc... has a "DNR" plan, but they were asked if a breathing tube was okay, which they agreed to.

There was a DSHS facilities investigation and the Complainant and his wife were informed that "all the medication was accounted for".

They received hospital records and noted a Dr. Givens had written Mr. 2 - Health... had been intubated in the past when he was treated for a UTI, which they said was not true.

They kept a journal of the incident and agreed to send a copy of it along with the second page of their complaint. The interview was then concluded.

~~Wallace VA~~

Dr. Buck - ER Dr.
2/8/11

Tuesday - When [redacted] was at MR at lunch time a nurse came in and told [redacted] and he that she had a "new medicine" for him.

Tuesday 1:20 - Charles called and said Dad was "unresponsive." He wanted to know if Dad should be sent to the hospital. Then I also was on the line and said yes. Charles did not make it very clear what unresponsive ~~was~~ meant.

When we got to the hospital he had arrived. ~~He~~ We waited for him to arrive. When we went to the back he told us he felt runny. He didn't have his teeth. Hard to understand.

Doctor told us he had narcotics/opium tested positive.

Dr. was going to give him Narcan to bring him around. When she did he came around for a few minutes then he would go to sleep again. ~~He was always sleep~~

Dr. Buck told us that's what they do for someone on drugs.

He rested comfortably for awhile then his blood pressure dropped way down and the medical staff started to revive him. He was almost gone. If they hadn't revived him.

Machine beeping over 20 mins

Told he needed to be tubed to get his blood pressure up. We said it was hard decision because he didn't want extra measures. Dr. said she would give him Narcan to wake him up and ask him. She did it twice 1st time No!! Second time she told him it would get his blood pressure up. He said yes!

Dr. Owens
Didn't see until 6:00 2/9/11

He was tubed. Did much better
Pressure up.
Had Cat Scan - No Stroke
X Rays of chest. - No pneumonia

2/9/10 Social Services - Talked to a gentleman. Asked if Dad was going back? Don't Know yet? 1:00 pm

5:30 moved to CCU to be ~~[illegible]~~ Closed monitered.
Sally Root - Nurse. - Great

2/9/11 On monitors all day Monitered very Closly

James. Nurse - Great

Weds 2/9/11

CCU all day

He was tubed

* Rested comfortably

* James took wonderful care.

About 6:30 we talked to

* Dr. Givens and she said that the tube could be removed so we authorized for it to be removed but she wanted to know if his pressure dropped would we put it back in. She said it would be best to do. [redacted] said ok as long as it would be for something fixable.

We left about 7:30 - 8:00

Turned every 45 mins to 1 hr.

Didn't see any Dr. until that night.

Dad's mental state was alert when the tube was removed. He knew us all but he was extremely tired.

We left about 1½ hrs. after the tube was removed. He was resting comfortably

Thursday 2/10/11

When we got there around 12:00 we were told that we had to gown up because he had MRSA. (weird)

* He was also started on breathing treatments when the Lady came in to give him the treatment James (his nurse) questioned why he was getting one that his chest sounded clear. The Lady was very short with him and told him that all she does is follow orders. And the orders came from Dr. Evans He was given this treatment every 4 hrs. through the night.

He was also given antibiotics for the MRSA.

His mental state was very good. Was bright and alert. Knew where he was and who we all were.

Friday 2/11/11 We arrived 12:15

Called about 10:30 am and he was a little confused on the phone. Asking about work just not himself like he was yesterday. Very groggy kept asking about work when was he leaving. Nurse Come in and took his blood for diabetics and she said it was high and started to talk to us about diabetics that when he returned that he would probably need to have a diabetic diet, got upset saying he has never been diabetic. He was given an insulin shot. He also had numerous breathing →

She also said that she was septic with the infections.

Dr. Givens finally come back around 6:30 and the first thing she said was if we went to court [redacted] with him having other infections we probably wouldn't have a leg to stand on. We were very uncomfortable for her to say that right off. She told us that his X-rays showed pneumonia and that he also had a UTI when he come in. She said We may never know what happened to him. Waiting on test from Quest but still we would not find out exactly what happened. We talked about moving him ~~but~~ to a different Rest home →

[redacted]

treatments.
Also today we had a paper put on his chart that he is not sign or talk to anyone without us there.
Nurse Pauline Stamon put it on his chart.
CCU

but we wouldn't because of Hilda. She also said she would never cover for anyone else. definitely not for a rest home. She also wanted to know if we wanted a feeding tube if he was not eating. We said no because he doesn't eat as much anyway.

Saturday 2/12/11

Moved from ICU to Rm. 315 at 2:00pm.
When we got to the hospital he was
extremely tired. did say some things that
didn't make sense.
Still in quarentine / No IVs just
still having antibotics

At 4:45 102/56 blood pressure
Ate dinner Soup / ½ Sandwich coffee.
Had Eggs for breakfast
Brought up PDA for chart.

Nurse Pm - Desiree
CNA - Lisa

Has rash on his upper body given Benedryl

Talked to Hilda

/

Sunday 2/13/11 BP: 126/60
We got there 2:30 pm. Blood Sugar 125
5:00
Dad was confused. Told us he
was looking for his shoes. He had
to go to get his hamburger.
Also told us there were rockets shooting
off on the hill across from the hospital.
He was talking about things that didn't
make any sense. He was wide awake
but talking nonsense. He knew who we
were and could tell the nurse his
name. He saw birds land outside the
window.

Rash on his body looks better.
No IVs
Did not see Dr.
Left at 7:30 pm

Monday 2/14/11

Went home to Monte at 2:00
Had to take the transit back
to Monte.
Had rash on his private area
Nursing supervisor came in and
told us that all meds were accounted
for. She also told us that the
narcan could have caused the false/pos
on the drug test.
We said that we assumed the drug
test was done before he got any Narcan
Rebecca also told us she saw him
before bed and he seemed fine.
Hilda was in bed when we got to Monte.
Dad napped and then we waited in the
dining room for them to get him
dressed. Again 1 person at first in dining room
They both come down for dinner. He
ate about 1/3 of his meal. Seemed
tired. Rebecca gave him Benedryl for
all of the rashes on his body.

Called the Complaint Hotline 8:00 2/14/11

Tue
Friday 25th

We stopped and talked to Cory Rux that is a paramedic. He was not the paramedic that took Dad to the hospital. Ron asked him why his father was given Narcan and he said they usually don't give it to patients unless they show ~~seizure~~ symptons of a drug. Dad had these symptons by what the report was that he looked at. So they administered the Narcan which he showed improvement within 15 mins.

Mr. Rux also told us that as a regular citizen he would follow through. He has never heard of Narcan showing a false positive. I told him that we are having an investigation done that Dr. Buck the ER. DR told us also to fill out papers to start an investigation. He also told us that we could get the records if we need them.

IDENTIFICATION
This 90-year-old male presente from Montesano Health and Rehabilitation Center because of the sudden onset of change in mental status. He responded some to Narcan initially and now has decreasing mental status. He was intubated in the emergency department.

HISTORY OF PRESENT ILLNESS
He was in his usual state of fair health, living at Montesano Health and Rehabilitation Center with his wife. His son reports that he saw the patient at lunch and he was in his usual state of health. Then, reportedly, he was found to be obtunded with shallow respirations. He had only moaning. He did wake up for the paramedics briefly after Narcan. At that time, he was transferred to the emergency department.

There, his paperwork showed he was DNR and they contacted the family. The patient was started on a Narcan drip. Because of intubation, he was given empiric ceftriaxone, 1 gram IV, normal saline boluses, and Zosyn 3.375 mg.

It was decided that the patient required intubation due to increasing difficulty protecting his airway. He had hypotension, responding to IV fluids. Upon talking with the family, he told his family that he wanted intubation if it was thought to be reversible, and the decision was made to pursue intubation.

After intubation, part of the workup included a toxicology screen, which was positive for oxycodone. The nursing home was contacted again and there was reportedly no prescribed oxycodone and no obvious thought how the patient could receive oxycodone.

His blood sugar at the time was 253. His family said this was a sudden change in his mental status. He has required intubation at times in the past and has had episodes of urinary tract infections, thought to be secondary to methicillin-resistant Staphylococcus aureus. He has had significant peripheral vascular disease and has been on chronic medications. He has had no fevers, chills, or other complaints.

This is not true except with his amputations unless with a UTI.

ALLERGIES
1. BACTRIM.
2. CLINDAMYCIN.

PAST MEDICAL HISTORY
1. Peripheral vascular disease, status post amputation bilaterally above the knee.
2. Hypertension.
3. GERD.
4. Peptic ulcer disease.
5. Hyperlipidemia.
6. BPH.

7. Iron-deficiency anemia.
8. History of GI bleed in 2008.
9. Depression.
10. Chronic atrial fibrillation.

MEDICATIONS
1. Remeron 15 mg p.o. q.h.s.
2. Citalopram 20 mg p.o. daily.
3. Norvasc 5 mg daily.
4. Diovan 80 mg daily.
5. Finasteride 8 mg p.o. daily.
6. Vitamin C 500 mg daily.
7. Multivitamin 1 daily.
8. Iron sulfate 325 mg daily.
9. Flomax 0.4 mg p.o. daily.
10. Omeprazole 20 mg p.o. daily.
11. Carafate 1 gram p.o. b.i.d.
12. Requip 1 mg p.o. q.h.s.

SOCIAL HISTORY
He lives at Montesano Health and Rehabilitation Center. He has a wife. A son and daughter-in-law assist in his care. Nonsmoker. No history of alcohol intake. No recreational drug use.

PHYSICAL EXAMINATION
VITAL SIGNS: Blood pressure 136/66, heart rate 64, respiratory rate 18, temperature 97.6, oxygen saturation 100% on the ventilator, 100% FiO2, tidal volume 500, PRVC 18, PEEP 5, pH 7.29, PCO2 28, PO2 207. Weight 54.5 kg.

NECK: No evidence of JVD.

LUNGS: Clear. Decreased in the bases.

HEART: Regular rate and rhythm.

ABDOMEN: Soft, nontender. No hepatosplenomegaly or masses.

EXTREMITIES: No clubbing, cyanosis or edema. As listed above, bilateral above-the-knee amputations.

NEUROLOGIC: Follows some commands. Moves extremities.

DIAGNOSTIC STUDIES
Pertinent lab work includes a sodium of 141, potassium 5.2, chloride 111, bicarbonate 23, BUN 40, creatinine 1.2, and glucose 291. White blood cell count 16.1, increased polys but no bandemia, hematocrit 41, MCV 95.9, platelets 230,000. Magnesium 2.2, bilirubin 0.1, ALT 15, AST 21, alkaline phosphatase 105. Troponin T less than 0.01.

Blood cultures x2 obtained. Sputum x2 obtained.

Urinalysis: 2+ leukocyte esterase, 1-5 white blood cells; culture pending.

Toxicology screen positive for oxycodone. A repeat was requested and that too was positive for oxycodone.

A head CT without contrast shows small-vessel disease.

Chest x-ray: No focal airspace disease. ET tube placement okay.

EKG: Atrial fibrillation at a rate of 102. Slow R wave progression. Nonspecific ST-T wave changes.

ASSESSMENT AND PLAN

1. Acute respiratory failure, obtunded, encephalopathic, unable to protect airway. This could possibly be secondary to oxycodone toxicity. This, however, was not prescribed and it is unclear exactly how the patient could have received this. A repeat toxicology screen, however, was positive. It certainly could be a real ingestion. It could be a false positive. His condition could also be sepsis secondary to urinary tract infection or possibly pneumonia. Sepsis can occasionally improve with Narcan as well temporarily and his episode was also complicated by hypotension. This could be systemic inflammatory response syndrome or sepsis. No obvious infiltrate. Clinically improved at this time. Long family discussion. We will attempt weaning parameters, hoping to extubate him and will follow sputum cultures carefully.

2. Pyuria. This could also be a urinary tract infection. The patient is on ceftriaxone. Follow cultures. IV hydration.

3. Systemic inflammatory response syndrome, present on admission, now with mild acute renal failure and dehydration. Aggressively hydrate.

4. Depression. Continue medications.

5. Candida of the skin, also suggested by sputum Gram's stain. Fluconazole and nystatin powder to skin folds. Multivitamin, zinc, vitamin C.

6. Gastroesophageal reflux. Continue Protonix.

7. Deep venous thrombosis prophylaxis. Lovenox subcutaneously 30 mg daily.

8. Hyperglycemia. Could be secondary to acute illness response. Check hemoglobin A1c. Sliding-scale insulin.

9. EKG showed atrial fibrillation, which is chronic. Rate controlled. Continue aspirin for cerebrovascular accident prophylaxis. Consider checking an echocardiogram.

10. Antihypertensives. Hold tonight in a setting of hypotension.

Valerie Foulds
712 Spruce Street
Hoquiam, Washington 98550-2218

RE: Control Number: 11-02-04370
Facility Name: Montesano Health & Rehab Center

Dear Ms. Foulds:

An investigator from RCS Region 6B has completed an unannounced investigation into the complaint referenced above. As you requested, a copy of the final investigation summary report is included with this letter.

As part of each on-site investigation, RCS obtains interview data from residents and families, facility staff, medical professionals and others; reviews the medical record; and conducts observations of residents and the facility environment. The focus of the RCS investigation is to determine if the facility/provider followed state and/or federal regulations regarding residents in their care. Failure to follow these regulations is considered failed facility practice or noncompliance. At this time, RCS did not identify failed facility practice (non-compliance) on the part of the provider named above.

You may contact the Field Manager Maureen Mead at (360) 725-2501 if you have any questions. Thank you again for sharing your concerns and for your assistance in helping to improve the quality of care for the vulnerable population in Washington State.

Sincerely,

G Van Vladricken

Investigation Summary Report

Control #: 11-02-04370 **License #:**1369 **Facility/Home:** Montesano Health & Rehab **Investigators:** Christine Kubiak **Region/Unit:** 6B
Licensee (AFH only): **Investigation Date(s):** 2/23/11
Complainant Contact Dates: 2/18/11, 2/28/11

Allegations:

1. Named Resident received overdose amount of Vicodin, which was not prescribed for the resident
2. Complainant had health and safety concerns for the resident's wife who is his roommate at the facility
3. Only one nursing assistant in the dining room assisting residents with their meals
4. Named Resident's adult briefs needed to be 70% soiled before it was changed

Investigation Methods:

☒ **Sample:** 2 Named Residents, 2 current residents
☒ **Observations:** 2 Named Residents, sampled residents, resident rooms/general environment, staff interactions with residents, care and services provided to residents during meals, availability of residents' incontinent briefs
☒ **interviews:** 2 Named Residents, 2 sampled residents, facility staff, nursing staff, others not associated with the facility
☒ **Record Reviews:** 2 Named Resident's record, 2 current residents' record, facility's accident/incident log and investigative reports, narcotic book

Investigation Summary:

1. Named Resident had an acute change in his level of consciousness and was sent to the Emergency Room (ER) for evaluation. The ER tested the named resident for drugs with a urine sample resulting in the urine being positive for oxycodone (pain narcotic) and notified the facility. The facility thoroughly investigated the distribution of their narcotics, checking all medication storage units, narcotic log books, residents' medication administration records and assessed the residents. No discrepancies or problems were found. The pharmacy verified medication accuracy of the named resident's used medication packets and the medications were accurate. The Named Resident's room was checked for medications and none were found. The facility thoroughly investigated the incident ruling out abuse and/or neglect with proper notification to the family, physician and State agency. Current residents or others not associated with the facility had no concerns with distribution of medications.

2. The Named Resident's wife was clean, well groomed and happy (smiling). The staff interacted with her in a helpful, caring and patient manner. She showed no signs of fear when staff approached her. The Named Resident's wife's record revealed the facility's interdisciplinary staff documented completely, appropriately and timely regarding the care and services provided to her. The sampled residents interacted with staff in a receptive manner without signs of fear. Staff were observed to be helpful, caring and patient with sampled and other residents. Current residents and others not associated with the facility were content with the care and services provided and voiced no safety concerns.

3. During the lunch meal, the facility's main dining room had a minimum of four staff and the three dining rooms on the halls had a minimum of two staff. The staff in the dining rooms assisted residents as needed with their meals in a timely manner. All residents received the level of assistance each required. Staff in the facility stated staffing was okay and could always be better. The Nursing Assistants (NA) said when staff call in sick, injure themselves, change jobs, go on vacation or extended sick leave, then more teamwork was required and overtime was always available. The NAs indicated the licensed nurses also pitched in and assisted with answering call lights, turning, and personal care. Sampled residents and others not associated with the facility indicated staff were available, helpful and very busy. No concerns of insufficient staff were voiced. There were no negative resident outcomes identified resulting from the residents not receiving proper care. This included but not limited to accidents, safety, skin breakdown, and cleanliness of residents/environment.

4. NAs said there were plenty of resident care supplies available within the facility to include incontinent pads. The NAs stated they checked and changed a resident at a minimum of every two hours and more often if needed. The NAs had not been told or heard of ensuring the brief was soiled a certain percentage before changing it. The Supply Coordinator (SC) stated there were no issues with ordering, purchasing and/or receiving resident [redacted] supplies. The SC explained the resident care supply room was accessible 24 hours a days, 7 days a week with a key maintained by one of the licensed nurses. The SC stated he was also available during his off duty hours to come in for anything needed. Sampled and random residents and others not associated with the facility indicated there were enough resident care supplies to include peri wash, incontinent pads, towels and linens. Sampled and random residents were well groomed, clean and without odor. No concerns of insufficient supplies or inadequate toileting/changing of incontinent briefs were voiced.

MEMORANDUM TO FILE

DATE: 03/21/11

TIME: 01:24 PM

CASE #: 2011-153821MD

RE: Interview with Kathy Stone, DNS

FROM: Connie Pyles, Health Care Investigator

I spoke with Kathy Stone, DNS today. She is familiar with the issues brought forth by the Complainant. She stated the NAC who gave Mr. 2 - Healthcare Inf... his medication is Laurie Justice. She wears braces and has a bit of a speech impediment. She had been unable to give him his morning medication on 02/08/11 as he was still asleep. She found him in the lunchroom with his son. She has informed Mr. Foulds, Sr. that she was there with his "noon" medications, not "new" medications. Ms. Stone had specifically asked her about this. Ms. Justice is willing to provide a statement to that effect. A statement form, along with a medical record request, will be faxed to Ms. Stone.

Ms. Stone informed me that Mr. 2 - Healthcare Inf... had been given Narcan by the medics on 02/08/11 when he was found unresponsive and at the ER. No urine sample had been collected prior to the administration of that medication. It can bring about false positive results. She also noted that Mr. 2 - Healthc... had been tested positive for marijuana at that hospital admission. This has caused her to question whether the hospital's lab test is accurate.

Mr. 2 - Healthcare Inf... is not prescribed any narcotics. Neither is his wife, Hilda, who had been given medication at the same time as her husband. She stated their narcotics log book had been reconciled for that day. She cannot think of a way that Mr. 2 - Healthcare Inf... could have gotten hold of any opiates. She has explained this to the Complainant.

Mr. 2 - Healthcare Info... is still at their facility and is back to his baseline status. I informed her I'd be sending a record request and she indicated she'd include a copy of her findings of the incident. The interview was then concluded.

MEDICAL QUALITY ASSURANCE COMMISSION
MEDICAL INVESTIGATIONS
STATEMENT FORM

File Number: 2011-153821MD

Statement of: LAURIE JUSTICE

Location where statement is taken: Montesano Health & Rehab

Statement: I approached Mr. 2 - Healthcare I... in the dining room where he was sitting at a table with his wife and son at approximately 11:50. I had medications for ~~to~~ Mr Foulds. And I said "Here are your noon meds." The pill I gave him (carafate) is scheduled for 1000, but I was giving it just before lunch because both Mr & Mrs 2 - Healthcare I... were sleeping at 1000. They had just gotten up to go to the dining room.

Mrs. 2 - Healthcare Inf... also recieves medications at noon so rather than disturbe them both, I decided to give Mr. 2 - Healthcar... his carafate at the same time as his wife takes her medications.

I certify (or declare) under penalty of perjury under the laws of the State of Washington that the foregoing is true and correct.

IDENTIFICATION
This 90-year-old male presents from Montesano Health and Rehabilitation Center because of the sudden onset of change in mental status. He responded some to Narcan initially and now has decreasing mental status. He was intubated in the emergency department.

HISTORY OF PRESENT ILLNESS
He was in his usual state of fair health, living at Montesano Health and Rehabilitation Center with his wife. His son reports that he saw the patient at lunch and he was in his usual state of health. Then, reportedly, he was found to be obtunded with shallow respirations. He had only moaning. He did wake up for the paramedics briefly after Narcan. At that time, he was transferred to the emergency department.

There, his paperwork showed he was DNR and they contacted the family. The patient was started on a Narcan drip. Because of intubation, he was given empiric ceftriaxone, 1 gram IV, normal saline boluses, and Zosyn 3.375 mg.

It was decided that the patient required intubation due to increasing difficulty protecting his airway. He had hypotension, responding to IV fluids. Upon talking with the family, he told his family that he wanted intubation if it was thought to be reversible, and the decision was made to pursue intubation.

After intubation, part of the workup included a toxicology screen, which was positive for oxycodone. The nursing home was contacted again and there was reportedly no prescribed oxycodone and no obvious thought how the patient could receive oxycodone.

His blood sugar at the time was 253. His family said this was a sudden change in his mental status. He has required intubation at times in the past and has had episodes of urinary tract infections, thought to be secondary to methicillin-resistant Staphylococcus aureus. He has had significant peripheral vascular disease and has been on chronic medications. He has had no fevers, chills, or other complaints.

PHYSICIAN PLEASE SIGN AND RETURN

This LN was notified of resident transport and admission to GHCH at 0357, I entered MHR at 0600 and started investigation, did a room check with the noc shift LN to look for any outside medications, witnessed narc count to all three med carts on LTC, pulled last 48 hour pixis info about stock and pulls, looked at the residents on the hall and no one except two residents received PRN, one at 1330 witnessed by this LN, and the other to a alert resident at 1440, both residents are alert and orientated None of the residents with a routine oxycodone at either 1800 or 2000 received any prn for break through pain.

Will contact Payless pharmacy to send back current medications to verify that what is on the label is what it is suppose to be.

Pm LN called at 0719 message left to contact either RCM, DNS or administrator and that we need her to come in the MHR.

State hotline called at 0740.

Medical director patients pcp called at 0950, stated to have ghch re-test to rule out a false positive, info forwarded to GHCH .

Naltrexone

From Wikipedia, the free encyclopedia

Naltrexone is an opioid receptor antagonist used primarily in the management of alcohol dependence and opioid dependence. It is marketed in generic form as its hydrochloride salt, **naltrexone hydrochloride**, and marketed under the trade names **Revia** and **Depade**. In some countries including the United States, a once-monthly extended-release formulation is marketed under the trade name **Vivitrol**. Also in the US, *Methylnaltrexone Bromide*, a closely related drug, is marketed as Relistor, for the treatment of opioid induced constipation.

Naltrexone should not be confused with naloxone (which is used in emergency cases of overdose rather than for longer-term dependence control) nor nalorphine. Both nalorphine and naloxone are full antagonists and will treat an opioid overdose, but naltrexone is longer-acting than naloxone (although neither is an irreversible antagonist like naloxazone), making naloxone a better emergency antidote.

Chemical structure

Naltrexone can be described as a substituted oxymorphone – here the tertiary amine methyl-substituent is replaced with methylcyclopropane.

Naltrexone is the N-cyclopropylmethyl derivative of oxymorphone.

Pharmacology

Naltrexone and its active metabolite 6-β-naltrexol are competitive antagonists at μ- and κ-opioid receptors, and to a lesser extent at δ-opioid receptors.[1] The plasma halflife of naltrexone is about 4 h, for 6-β-naltrexol 13 h. The blockade of opioid receptors is the basis behind its action in the management of opioid dependence—it reversibly blocks or attenuates the effects of opioids.

Its use in alcohol (ethanol) dependence has been studied and has been shown to be effective [1]. Its mechanism of action in this indication is not fully understood, but as an opioid-receptor antagonist it's likely to be due[*citation needed*] to the modulation of the dopaminergic mesolimbic pathway which is hypothesised to be a major center of the reward associated with addiction (being one of the primary centers for risk-reward analysis in the brain, and a tertiary "pleasure center") that all major drugs of abuse are believed to activate.

Naltrexone is metabolised mainly to 6β-naltrexol by the liver enzyme dihydrodiol dehydrogenase. Other metabolites include 2-hydroxy-3-methoxy-6β-naltrexol and 2-hydroxy-3-methoxy-naltrexone. These are then further metabolised by conjugation with glucuronide.

Rapid detoxification

Naltrexone is sometimes used for rapid detoxification ("rapid detox") regimens for opioid dependence. The principle of rapid detoxification is to induce opioid-receptor blockage while the patient is in a state of impaired consciousness, so as to attenuate the withdrawal symptoms experienced by the patient. Rapid detoxification under general anaesthesia involves an unconscious patient and requires intubation and external ventilation. Rapid detoxification is also possible under sedation. The rapid detoxification procedure is followed by oral naltrexone daily for up to 12 months for opioid dependence management. There are a number of practitioners who will use a naltrexone implant, usually placed in the lower abdomen, to replace the oral naltrexone. This implant procedure has not been shown scientifically to be successful in "curing" subjects of their addiction, though it does provide a better solution than oral naltrexone for medication compliance reasons. There is currently scientific disagreement as to whether this procedure should be performed under local or general anesthesia, due to the rapid, and sometimes severe, withdrawal that occurs from the naltrexone displacing the opiates from the receptor sites.

Rapid detoxification has been criticised by some for its questionable efficacy in long-term opioid dependence management.[2] Rapid detoxification has often been misrepresented as a one-off "cure" for

opioid dependence, when it is only intended as the initial step in an overall drug rehabilitation regimen. Rapid detoxification is effective for short-term opioid detoxification, but is approximately 10 times more expensive than conventional detoxification procedures. Aftercare can also be an issue,[2] since at least one well-known center in the United States reported that they will remove an implant from any patient arriving in their facility before admission.[*citation needed*]

The usefulness of naltrexone in opioid dependence is very limited by the low retention in treatment. Like disulfiram in alcohol dependence, it temporarily blocks substance intake and does not affect craving. Sustained-release preparations of naltrexone have shown rather promising results, it remains a treatment only for a small part of the opioid-dependent population, usually the ones with an unusually stable social situation and motivation (e.g., dependent health care professionals). It is given orally by physicians to help reduce the side effects of opiate dependence. Naltrexone implants have been used successfully in Australia for a number of years as part of a long-term protocol for treating opiate addiction. Naltrexone treats the physical dependence on opioids, but further psychosocial interventions are often required to enable people to maintain abstinence.[3]

Alcohol dependence

The main use of naltrexone is for the treatment of alcohol dependence. After publication of the first two randomized, controlled trials in 1992, a number of studies have confirmed its efficacy in reducing frequency and severity of relapse to drinking.[4] The multi-center COMBINE study has recently proven the usefulness of naltrexone in an ordinary, primary care setting, without adjunct psychotherapy.[5]. Mechanism of action may be antagonism to endogenous opiates such as tetrahydropapaveroline, whose production is augmented in the presence of alcohol.[6]

The standard regimen is one 50 mg tablet per day. Initial problems of nausea usually disappear after a few days, and other side effects (e.g., heightened liver enzymes) are rare. Drug interactions are not significant, besides the obvious antagonism of opioid analgesics. Naltrexone has two effects on alcohol consumption.[7] The first is to reduce craving while naltrexone is being taken. The second, referred to as the Sinclair Method, occurs when naltrexone is taken in conjunction with normal drinking, and this reduces craving over time. The first effect persists only while the naltrexone is being taken, but the second persists as long as the alcoholic does not drink without first taking naltrexone.

Roy Eskapa, who wrote a book advocating the Sinclair Method, argues that Naltrexone does not work in conjunction with abstinence.[8] Eskapa cites as evidence a Finnish clinical trial in which "Naltrexone tended to be worse than those for placebo,"[9] and two studies that produced "almost identical graphs": an alcoholism clinical trial at Yale[10] and a Nalurexone for cocaine addiction trial at the University of Texas.[11]

Depot injectable naltrexone (Vivitrol, formerly Vivitrex, but changed after a request by the FDA) was approved by the FDA on April 13, 2006 for the treatment of alcohol dependence.[12] This version is made and marketed by Alkermes in the United States, and is marketed by Johnson & Johnson in Russia. Cephalon Inc. originally marketed the drug in the United States, however, Alkermes reclaimed Vivitrol commercialization rights in 2008.[13] The recommended dose of Vivitrol 380 mg is delivered intramuscularly once a month. The injection should be administered by a healthcare professional.[14]

The clinical trial that the approval of Vivitrol was based on showed that when compared with a placebo, 380 mg of Vivitrol resulted in a 25% decrease in the event rate of heavy drinking days and 190 mg

resulted in a 17% decrease. The 6-month randomized, double-blind, placebo-controlled study was conducted between February 2002 and September 2003. Of the 899 individuals screened, 627 were diagnosed as alcohol-dependent adults and were randomized to receive treatment. The main outcome measure was the event rate of heavy drinking days in the intent-to-treat population. The study's authors concluded that: "Long-acting naltrexone was well tolerated and resulted in reductions in heavy drinking among treatment-seeking alcohol dependent patients during 6 months of therapy."[15]

Another study released by the National Institute of Health in February 2008 and published in the *Archives of General Psychiatry* has shown that alcoholics having a certain gene variant of the opioid receptor were far more likely to experience success at cutting back or discontinuing their alcohol intake altogether.[16]

Opiate addiction

Naltrexone helps patients overcome urges to abuse opiates by blocking the drugs' euphoric effects. While some patients do well with the oral formulation, there is a drawback in that it must be taken daily, and a patient whose craving becomes overwhelming can obtain opiate euphoria simply by skipping a dose before resuming abuse.

The FDA approved Vivitrol, the long-acting version of naltrexone, on October 12, 2010 for the prevention of relapse to opioid dependence, following opioid detoxification. "This drug approval represents a significant advancement in addiction treatment," said Janet Woodcock, M.D., director of the FDA's Center Drug Evaluation and Research.[17]

Nora Volkow, M.D., Director of the National Institute on Drug Abuse (NIDA), stated that: "As a depot formulation, dosed monthly, Vivitrol obviates the daily need for patients to motivate themselves to stick to a treatment regimen - a formidable task, especially in the face of multiple triggers of craving and relapse. This new option increases the pharmaceutical choices for treating opioid addiction, and may be seen as advantageous by those unwilling to consider agonist or partial agonist approaches to treatment. NIDA is continuing to support research on Vivitrol's effectiveness in this country, including a focus on criminal justice involved populations transitioning back into the community."[18]

The phase 3 clinical study upon which the FDA granted approval for Vivitrol in treating opioid dependence had an enrollment of 250. Primary outcome measures were percent of weekly urine tests that were negative for opioids and the length of the study retention during the double-blind period. The study began in June 2008 and was completed in November 2009.

Alkermes presented positive results from the phase 3 clinical study of Vivitrol for the treatment of opioid dependence at the American Psychiatric Association 2010 Annual Meeting in May 2010. The study met its primary efficacy endpoint and data showed that patients treated once-monthly with Vivitrol demonstrated statistically significant higher rates of clean (opioid-free) urine screens, compared to patients treated with a placebo, as measured by the cumulative distribution of clean urine screens ($p<0.0002$).[19] The results of the study are expected to be published soon.

Another option for the treatment of opiate addiction is the naltrexone implant, which may be surgically inserted under the skin. The implant provides a sustained dose of naltrexone to the patient, thereby preventing the problems which may be associated with skipping doses. It must be replaced every several months. Naltrexone implants are made by at least three companies, though none have been approved by the U.S. Food and Drug Administration (FDA) or the Australian Therapeutic Goods Administration.[20]

Safety

In alcohol dependence, naltrexone is considered a safe medication. Control of liver values prior to initiation of treatment is recommended. There has been some controversy regarding the use of opioid-receptor antagonists, such as naltrexone, in the long-term management of opioid dependence due to the effect of these agents in sensitising the opioid receptors. That is, after therapy, the opioid receptors continue to have increased sensitivity for a period during which the patient is at increased risk of opioid overdose. This effect reinforces the necessity of monitoring of therapy and provision of patient support measures by medical practitioners.

Other uses

Low dose naltrexone (LDN)

Main article: Low dose naltrexone

Low dose naltrexone (LDN), where the drug is used in doses approximately one-tenth those used for drug/alcohol rehabilitation purposes, is being used by some as an "off-label" experimental treatment for certain immunologically-related disorders,[21] including HIV/AIDS,[22] multiple sclerosis[23] (in particular, the primary progressive variant,[24]) cancer,[25] fibromyalgia,[26] autoimmune diseases such as[*citation needed*] rheumatoid arthritis, ankylosing spondylitis, transverse myelitis, Crohn's disease, ulcerative colitis, Hashimoto's thyroiditis, and central nervous system disorders.[*citation needed*] Certain medications will work against the naltrexone such as Hydrocodone, Oxycodone, Oxymorphone and other opiate/opioid narcotics.[*citation needed*] These medications should not be taken while on Naltrexone, as nausea, vomiting, cold sweats, chills, and sometimes numbness in the limbs may occur.[*citation needed*] Naltrexone may also interfere or counteract both low and high doses of over-the-counter NSAID medications.[*citation needed*]

One study showed that LDN did not help with Parkinson's disease.[27]

Sexual dysfunction

Naltrexone can induce early morning erections in patients who suffer from psychogenic erectile dysfunction. The exact pathway of this effect is unknown. Priapism has been reported in two individuals receiving Vivitrol.

Naltrexone has been shown to be effective in the reversal of sexual satiety and exhaustion in male rats.[28]

Tobacco study

The Chicago Stop Smoking Research Project at the University of Chicago studied whether naltrexone could be used as an aid to quit smoking. The researchers discovered that Naltrexone improved smoking cessation rates in women by fifty percent, but showed no improvement for men.[29]

Use for Crohn's disease

In a clinical trial conducted by Pennsylvania State University, it was concluded that low dose naltrexone helped people with Crohn's disease, putting the disease into remission in many cases, though it was stated that further study would be required.[30]

Self-injurious behaviors

Some studies suggest that self-injurious behaviors present in developmentally disabled and autistic people can sometimes be remedied with naltrexone.[31] In these cases, it is believed that the self-injury is being done to release beta-endorphin, which binds to the same receptors as heroin and morphine.[32] By removing the "rush" generated by self-injury, the behavior may stop.

Kleptomania

There are indications that naltrexone might be beneficial in the treatment of impulse control disorders such as kleptomania (compulsive stealing), trichotillomania, or pathological gambling.[33]

Study in overweight and obese patients

Clinical trials are ongoing regarding the use of naltrexone in combination with another drug, bupropion, as a weight loss therapy.[34]

Autism

Dr. Jaak Panksepp of Washington State University has conducted studies using naltrexone to treat patients with autism. He found that half the autistic children treated with the drug become more social. [35]

Evaluation of Opiate results

Cut-off value

300 ng/mL

Cross-reactivity

This assay detects morphine, heroin (diacetylmorphine), 6-monoacetyl morphine, codeine, dihydrocodeine, hydrocodone, hydromorphone, and oxycodone (in high levels).

This assay will not detect methadone or buprenorphine (a buprenorphine assay is available at an extra charge).

Metabolism

Heroin (half-life = 10 minutes) is rapidly metabolised to 6-monoacetyl morphine and morphine. 80% of the dose is excreted within 24 hours.

Morphine (half-life = 2 hours) is metabolised to morphine-3 and morphine-6 glucuronides. 84% of the dose is excreted within 8 hours.

Codeine (half-life = 3 hours) is metabolised to morphine (except in 10% of the Caucasian population) and norcodeine. 86% of the dose is excretad within 24 hours.

Dihydrocodeine (half-life = 4 hours) is metabolised to nordihydrocodeine and dihydromorphine. 20–30% of the dose is excreted within 24 hours.

Hydrocodone (half-life = 4 hours) is a metabolite of codeine. 26% of the dose is excreted in 72 hours. Hydrocodone is metabolised to hydromorphone.

Hydromorphone (half-life = 1.5–4 hours). 36% of the dose is excreted within 72 hours.

Heroin, morphine, and their metabolites are usually detectable *for 36–48 hours following a standard dose.*

Some of these compounds are present in prescription and over-the-counter preparations. Thin Layer Chromatography (or Gas Chromatography/Mass Spectrometry [GC/MS], if the results will be used for medico-legal purposes) is available on request to identify any cross-reacting compound present, if this is suspected.

Interferences

High levels of naltrexone may cause false positive results.

Blood cultures x2 obtained. Sputum x2 obtained.

Urinalysis: 2+ leukocyte esterase, 1-5 white blood cells; culture pending.

Toxicology screen positive for oxycodone. A repeat was requested and that too was positive for oxycodone.

A head CT without contrast shows small-vessel disease.

Chest x-ray: No focal airspace disease. ET tube placement okay.

EKG: Atrial fibrillation at a rate of 102. Slow R wave progression. Nonspecific ST-T wave changes.

ASSESSMENT AND PLAN

1. Acute respiratory failure, obtunded, encephalopathic, unable to protect airway. This could possibly be secondary to oxycodone toxicity. This, however, was not prescribed and it is unclear exactly how the patient could have received this. A repeat toxicology screen, however, was positive. It certainly could be a real ingestion. It could be a false positive. His condition could also be sepsis secondary to urinary tract infection or possibly pneumonia. Sepsis can occasionally improve with Narcan as well temporarily and his episode was also complicated by hypotension. This could be systemic inflammatory response syndrome or sepsis. No obvious infiltrate. Clinically improved at this time. Long family discussion. We will attempt weaning parameters, hoping to extubate him and will follow sputum cultures carefully.

2. Pyuria. This could also be a urinary tract infection. The patient is on ceftriaxone. Follow cultures. IV hydration.

3. Systemic inflammatory response syndrome, present on admission, now with mild acute renal failure and dehydration. Aggressively hydrate.

4. Depression. Continue medications.

5. Candida of the skin, also suggested by sputum Gram's stain. Fluconazole and nystatin powder to skin folds. Multivitamin, zinc, vitamin C.

6. Gastroesophageal reflux. Continue Protonix.

7. Deep venous thrombosis prophylaxis. Lovenox subcutaneously 30 mg daily.

8. Hyperglycemia. Could be secondary to acute illness response. Check hemoglobin A1c. Sliding-scale insulin.

9. EKG showed atrial fibrillation, which is chronic. Rate controlled. Continue aspirin for cerebrovascular accident prophylaxis. Consider checking an echocardiogram.

IDENTIFICATION
This 90-year-old male presents from Montesano Health and Rehabilitation Center because of the sudden onset of change in mental status. He responded some to Narcan initially and now has decreasing mental status. He was intubated in the emergency department.

HISTORY OF PRESENT ILLNESS
He was in his usual state of fair health, living at Montesano Health and Rehabilitation Center with his wife. His son reports that he saw the patient at lunch and he was in his usual state of health. Then, reportedly, he was found to be obtunded with shallow respirations. He had only moaning. He did wake up for the paramedics briefly after Narcan. At that time, he was transferred to the emergency department.

There, his paperwork showed he was DNR and they contacted the family. The patient was started on a Narcan drip. Because of intubation, he was given empiric ceftriaxone, 1 gram IV, normal saline boluses, and Zosyn 3.375 mg.

It was decided that the patient required intubation due to increasing difficulty protecting his airway. He had hypotension, responding to IV fluids. Upon talking with the family, he told his family that he wanted intubation if it was thought to be reversible, and the decision was made to pursue intubation.

After intubation, part of the workup included a toxicology screen, which was positive for oxycodone. The nursing home was contacted again and there was reportedly no prescribed oxycodone and no obvious thought how the patient could receive oxycodone.

His blood sugar at the time was 253. His family said this was a sudden change in his mental status. He has required intubation at times in the past and has had episodes of urinary tract infections, thought to be secondary to methicillin-resistant Staphylococcus aureus. He has had significant peripheral vascular disease and has been on chronic medications. He has had no fevers, chills, or other complaints.

ALLERGIES
1. BACTRIM.
2. CLINDAMYCIN.

PAST MEDICAL HISTORY
1. Peripheral vascular disease, status post amputation bilaterally above the knee.
2. Hypertension.
3. GERD.
4. Peptic ulcer disease.
5. Hyperlipidemia.
6. BPH.

7. Iron-deficiency anemia.
8. History of GI bleed in 2008.
9. Depression.
10. Chronic atrial fibrillation.

MEDICATIONS
1. Remeron 15 mg p.o. q.h.s.
2. Citalopram 20 mg p.o. daily.
3. Norvasc 5 mg daily.
4. Diovan 80 mg daily.
5. Finasteride 8 mg p.o. daily.
6. Vitamin C 500 mg daily.
7. Multivitamin 1 daily.
8. Iron sulfate 325 mg daily.
9. Flomax 0.4 mg p.o. daily.
10. Omeprazole 20 mg p.o. daily.
11. Carafate 1 gram p.o. b.i.d.
12. Requip 1 mg p.o. q.h.s.

SOCIAL HISTORY
He lives at Montesano Health and Rehabilitation Center. He has a wife. A son and daughter-in-law assist in his care. Nonsmoker. No history of alcohol intake. No recreational drug use.

PHYSICAL EXAMINATION
VITAL SIGNS: Blood pressure 136/66, heart rate 64, respiratory rate 18, temperature 97.6, oxygen saturation 100% on the ventilator, 100% FiO2, tidal volume 500, PRVC 18, PEEP 5, pH 7.29, PCO2 28, PO2 207. Weight 54.5 kg.

NECK: No evidence of JVD.

LUNGS: Clear. Decreased in the bases.

HEART: Regular rate and rhythm.

ABDOMEN: Soft, nontender. No hepatosplenomegaly or masses.

EXTREMITIES: No clubbing, cyanosis or edema. As listed above, bilateral above-the-knee amputations.

NEUROLOGIC: Follows some commands. Moves extremities.

DIAGNOSTIC STUDIES
Pertinent lab work includes a sodium of 141, potassium 5.2, chloride 111, bicarbonate 23, BUN 40, creatinine 1.2, and glucose 291. White blood cell count 16.1, increased polys but no bandemia, hematocrit 41, MCV 95.9, platelets 230,000. Magnesium 2.2, bilirubin 0.1, ALT 15, AST 21, alkaline phosphatase 105. Troponin T less than 0.01.

Blood cultures x2 obtained. Sputum x2 obtained.

Urinalysis: 2+ leukocyte esterase, 1-5 white blood cells; culture pending.

Toxicology screen positive for oxycodone. A repeat was requested and that too was positive for oxycodone.

A head CT without contrast shows small-vessel disease.

Chest x-ray: No focal airspace disease. ET tube placement okay.

EKG: Atrial fibrillation at a rate of 102. Slow R wave progression. Nonspecific ST-T wave changes.

ASSESSMENT AND PLAN

1. Acute respiratory failure, obtunded, encephalopathic, unable to protect airway. This could possibly be secondary to oxycodone toxicity. This, however, was not prescribed and it is unclear exactly how the patient could have received this. A repeat toxicology screen, however, was positive. It certainly could be a real ingestion. It could be a false positive. His condition could also be sepsis secondary to urinary tract infection or possibly pneumonia. Sepsis can occasionally improve with Narcan as well temporarily and his episode was also complicated by hypotension. This could be systemic inflammatory response syndrome or sepsis. No obvious infiltrate. Clinically improved at this time. Long family discussion. We will attempt weaning parameters, hoping to extubate him and will follow sputum cultures carefully.

2. Pyuria. This could also be a urinary tract infection. The patient is on ceftriaxone. Follow cultures. IV hydration.

3. Systemic inflammatory response syndrome, present on admission, now with mild acute renal failure and dehydration. Aggressively hydrate.

4. Depression. Continue medications.

5. Candida of the skin, also suggested by sputum Gram's stain. Fluconazole and nystatin powder to skin folds. Multivitamin, zinc, vitamin C.

6. Gastroesophageal reflux. Continue Protonix.

7. Deep venous thrombosis prophylaxis. Lovenox subcutaneously 30 mg daily.

8. Hyperglycemia. Could be secondary to acute illness response. Check hemoglobin A1c. Sliding-scale insulin.

9. EKG showed atrial fibrillation, which is chronic. Rate controlled. Continue aspirin for cerebrovascular accident prophylaxis. Consider checking an echocardiogram.

10. Antihypertensives. Hold tonight in a setting of hypotension.

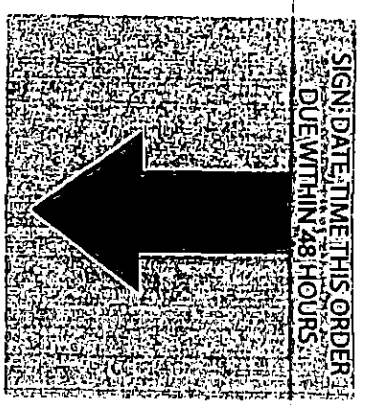
GIVBA/MEM D: 02/13/2011 at 19:02 T: 02/13/2011 at 19:19 J: 10644505 Doc: 20048393

CC: Michael Buben, DO



TTENDING HOSPITALIST:
ıny G. Bashandy, MD

PRIMARY CARE PROVIDER:
Richard D. Lewis, MD

DATE OF ADMISSION:
1/19/2009 at 2345 hours.

CODE STATUS:
Do-not-resuscitate and do-not-intubate.

CHIEF COMPLAINT:
Altered mental status.

HISTORY OF PRESENT ILLNESS:
This 88-year-old skilled nursing facility resident apparently had increased confusion today at Montesano Health and Rehab. He was reported to have difficulty holding objects in his right hand. There was a reported right facial droop that had resolved and resolved right upper extremity weakness for an unspecified period of time. The patient is currently disoriented and provides no further insight into the nature of his problems. He has no specific complaints at this time. There is no specific prior history of a cerebrovascular accident.

PAST MEDICAL HISTORY:
1. Gastroesophageal reflux disease.
2. Previous history of peptic ulcer disease.
3. Hypertension.
4. Hyperlipidemia.
5. Peripheral vascular disease.
6. Benign prostatic hypertrophy.
7. Iron deficiency anemia.
8. Bilateral above-knee-amputation.
9. Upper gastrointestinal bleed, in June of 2008.

Surgeries:
1. Bilateral above-knee-amputation at two different times, both secondary to peripheral vascular disease.
2. Fiberoptic esophagogastroduodenoscopy, in June of 2008, showing gastritis with friable mucosa.

Allergies: No known drug allergies.

Medications:
1. Diovan 80 mg p.o. daily.
2. Norvasc 5 mg p.o. daily.

Finasteride 5 mg p.o. daily.
Flomax 0.4 mg p.o. daily.
Iron sulfate 325 mg p.o. daily.
6. Flonase spray 1 spray daily.
7. Multivitamin daily.
8. Requip 1 mg daily.
9. Protonix 80 mg p.o. b.i.d.
10. Calcium 500 mg with vitamin D p.o. daily.
11. Mylanta 30 mL p.r.n. with meals.
12. Reglan 10 mg p.o. t.i.d.
13. Carafate 1 gm p.o. q.i.d.
14. Citalopram 10 mg p.o. daily.
Remeron 50 mg p.o. h.s.

FAMILY HISTORY:
Noncontributory.

SOCIAL HISTORY:
The patient resides at Montesano Health and Rehab. He is married. He does not currently smoke, drink or use illicit drugs.

REVIEW OF SYSTEMS:
Unable to obtain an accurate review of systems due to confusion.

PHYSICAL EXAMINATION:
VITAL SIGNS ON ADMISSION TO ER: Temperature 98.7, pulse 72, respiratory rate 1[illegible] blood pressure 165/79. SpO2 100% on room air.

GENERAL: No acute distress.

HEENT: Normocephalic, atraumatic. Pupils are equal, round, and reactive to light and accommodation. Arcus senilis present.

NECK: No thyromegaly or lymphadenopathy. No carotid bruits.

LUNGS: Clear to auscultation.

HEART: Irregular at times. No murmur, gallop or rub. No S3, S4.

ABDOMEN: Soft, nontender.

EXTREMITIES: Bilateral amputations above the knee. In both upper extremities, distal pulses intact.

NEUROLOGIC: Nonfocal. Disoriented times 3. The patient states that he is on a ship, the year is 1950 and the month is October. Cranial nerves II through XII grossly intact. The patient does not cooperate with full neurologic exam. Grips are equal in both upper extremities, negative for pronator drift. Fine motor coordination intact in right and left hand.

TN: Pale pink.

DIAGNOSTIC STUDIES:
CBCD: White blood cell count within normal limits. Hemoglobin and hematocrit mildly decreased at 12.7 and 38.

Basic metabolic panel: BUN mildly increased at 36.3 with a normal glomerular filtration rate greater than 59.

Urinalysis positive for 2+ leukocyte esterase, 20 to 30 white blood cells per high-power field, and a moderate amount of bacteria. Urine culture is pending.

Head CT scan showing nonspecific white matter changes per preliminary radiology report.

ASSESSMENT AND PLAN:
1. Altered mental status, likely secondary to urinary tract infection. We will give antibiotics. There was some question of focal neurologic findings in the emergency room and Montesano Health and Rehab, now resolved. The patient has a history of an upper gastrointestinal bleed. We will consider aspirin. We will discuss this with attending first. We will perform serial neurologic examinations.
2. Urinary tract infection. IV antibiotics were started. This is likely the source of the patient's worsening altered mental status and confusion. We will adjust antimicrobial therapy as needed per urine culture and sensitivities.
3. Acute renal failure. This is mild, with only an elevation of BUN, normal creatinine. We will give IV fluids gently and reassess BUN and creatinine as well as glomerular filtration rate in the a.m.
4. Hypertension, poorly controlled. We will continue the patient's antihypertensives.
5. History of gastrointestinal bleed. We will continue the patient's Carafate, Reglan, and Protonix.
6. Benign prostatic hypertrophy, continue Flomax and finasteride.
7. Deep venous thrombosis prophylaxis with Lovenox.

DISPOSITION:
We will discuss the above plan of care with attending physician, Dr. Bashandy.

Hany G. Bashandy, MD
(Dictated by Daniel Hahn, PA-C)

OPERATIVE REPORT

DATE OF ADMISSION: 10/21/2008
DATE OF PROCEDURE: 10/21/2008 PT TYPE: P

PREOPERATIVE DIAGNOSIS(ES):
Left leg ischemia.

POSTOPERATIVE DIAGNOSIS(ES):
Left leg ischemia.

ERATION(S) PERFORMED:
t above-knee amputation.

RGEON:
David M Deitz, MD.

ASSISTANT:
Christopher S Johnson, PA.

ANESTHESIA:
Spinal with epidural supplement, Dr. Sharangpani.

INDICATIONS:
The patient is an almost 88-year-old male in whom I did a right-to-left femoral-femoral bypass graft in November 2006 followed 1 week later by a left n-pop below-knee bypass with reverse saphenous vein. This was done for limb lvage. He subsequently developed gangrenous changes in his right leg and I d a right above-knee amputation in January 2007. More recently he developed ulceration on his left heel which has worsened and also has developed multiple ulcerations beginning in the mid left calf. A recent evaluation in the vascular lab revealed that the fem-pop bypass graft was occluded. The femoral-femoral graft was opened. Th left ABI was 0.4. After discussing things with the patient and his family in the office, the decision was made to do a primary above-knee amputation.

FINDINGS:
The muscle tissue appeared to be satisfactorily vascularized. The skin edges at the amputation site looked quite viable.

SCRIPTION:
e patient was brought to the operating room after having been in the holding cea where the spinal anesthetic and epidural catheter were placed. He was entified in the operating room and placed on the table in a supine position. he left lower extremity was prepped and sterilely draped. The left leg below the knee was covered with a stockinette and Coban wrap.

A fishmouth type incision was marked out on the left thigh a short distance above the knee. The skin incisions were made and carried down into the

subcutaneous tissues. The cautery was used to divide the subcutaneous tissue and the muscle tissue. I got down to the femur. It was cleaned circumferentially. I used the periosteal elevator to elevate the periosteum in a proximal direction. The oscillating saw was then used to divide the femur well above the level that the muscle tissue had been divided. Posterior to this, the neurovascular pedicle was identified. The occluded superficial femoral artery was dissected out, clamped, divided, and ligated with 2-0 silk ligatures. The adjacent vein was separately clamped, divided, and ligated with 2-0 silk ligatures and the sciatic nerve was clamped and divided. I then ilized it proximally about 4 cm and clamped it at that level. A 2-0 silk was d to ligate the nerve at that level and it was divided just beyond the more oximal clamp allowing it to retract well up into the stump. The posterior scular tissues and subcutaneous tissues were divided with the cautery and the distal leg was removed from the field. The edge of the femur was smoothed over using the rasp. The stump was irrigated with saline solution. A hemostatic check was made. I then closed the deeper muscular tissue over top of the transected end of the femur with several interrupted 3-0 Vicryl sutures. The superficial fascial layer was then approximated with interrupted 3-0 Vicryl sutures. The subcutaneous tissues were closed with a running 3-0 Vicryl and the skin was then closed with interrupted 3-0 nylon sutures. The wound was cleaned. Gauze 4 x 4, Kerlix wraps, and Ace wraps were applied.

Sponge and needle counts were reported as correct. Blood loss was estimated at cc. The patient was stable on transfer to the recovery room.

David M Deitz, M.D.

IDENTIFICATION
This 90-year-old male presents from Montesano Health and Rehabilitation Center because of the sudden onset of change in mental status. He responded some to Narcan initially and now has decreasing mental status. He was intubated in the emergency department.

HISTORY OF PRESENT ILLNESS
He was in his usual state of fair health, living at Montesano Health and Rehabilitation Center with his wife. His son reports that he saw the patient at lunch and he was in his usual state of health. Then, reportedly, he was found to be obtunded with shallow respirations. He had only moaning. He did wake up for the paramedics briefly after Narcan. At that time, he was transferred to the emergency department.

There, his paperwork showed he was DNR and they contacted the family. The patient was started on a Narcan drip. Because of intubation, he was given empiric ceftriaxone, 1 gram IV, normal saline boluses, and Zosyn 3.375 mg.

It was decided that the patient required intubation due to increasing difficulty protecting his airway. He had hypotension, responding to IV fluids. Upon talking with the family, he told his family that he wanted intubation if it was thought to be reversible, and the decision was made to pursue intubation.

After intubation, part of the workup included a toxicology screen, which was positive for oxycodone. The nursing home was contacted again and there was reportedly no prescribed oxycodone and no obvious thought how the patient could receive oxycodone.

His blood sugar at the time was 253. His family said this was a sudden change in his mental status. He has required intubation at times in the past and has had episodes of urinary tract infections, thought to be secondary to methicillin-resistant Staphylococcus aureus. He has had significant peripheral vascular disease and has been on chronic medications. He has had no fevers, chills, or other complaints.

ALLERGIES
1. BACTRIM.
2. CLINDAMYCIN.

PAST MEDICAL HISTORY
1. Peripheral vascular disease, status post amputation bilaterally above the knee.
2. Hypertension.
3. GERD.
4. Peptic ulcer disease.
5. Hyperlipidemia.
6. BPH.

7. Iron-deficiency anemia.
8. History of GI bleed in 2008.
9. Depression.
10. Chronic atrial fibrillation.

MEDICATIONS
1. Remeron 15 mg p.o. q.h.s.
2. Citalopram 20 mg p.o. daily.
3. Norvasc 5 mg daily.
4. Diovan 80 mg daily.
5. Finasteride 8 mg p.o. daily.
6. Vitamin C 500 mg daily.
7. Multivitamin 1 daily.
8. Iron sulfate 325 mg daily.
9. Flomax 0.4 mg p.o. daily.
10. Omeprazole 20 mg p.o. daily.
11. Carafate 1 gram p.o. b.i.d.
12. Requip 1 mg p.o. q.h.s.

SOCIAL HISTORY
He lives at Montesano Health and Rehabilitation Center. He has a wife. A son and daughter-in-law assist in his care. Nonsmoker. No history of alcohol intake. No recreational drug use.

PHYSICAL EXAMINATION
VITAL SIGNS: Blood pressure 136/66, heart rate 64, respiratory rate 18, temperature 97.6, oxygen saturation 100% on the ventilator, 100% FiO2, tidal volume 500, PRVC 18, PEEP 5, pH 7.29, PCO2 28, PO2 207. Weight 54.5 kg.

NECK: No evidence of JVD.

LUNGS: Clear. Decreased in the bases.

HEART: Regular rate and rhythm.

ABDOMEN: Soft, nontender. No hepatosplenomegaly or masses.

EXTREMITIES: No clubbing, cyanosis or edema. As listed above, bilateral above-the-knee amputations.

NEUROLOGIC: Follows some commands. Moves extremities.

DIAGNOSTIC STUDIES
Pertinent lab work includes a sodium of 141, potassium 5.2, chloride 111, bicarbonate 23, BUN 40, creatinine 1.2, and glucose 291. White blood cell count 16.1, increased polys but no bandemia, hematocrit 41, MCV 95.9, platelets 230,000. Magnesium 2.2, bilirubin 0.1, ALT 15, AST 21, alkaline phosphatase 105. Troponin T less than 0.01.

Blood cultures x2 obtained. Sputum x2 obtained.

Urinalysis: 2+ leukocyte esterase, 1-5 white blood cells; culture pending.

Toxicology screen positive for oxycodone. A repeat was requested and that too was positive for oxycodone.

A head CT without contrast shows small-vessel disease.

Chest x-ray: No focal airspace disease. ET tube placement okay.

EKG: Atrial fibrillation at a rate of 102. Slow R wave progression. Nonspecific ST-T wave changes.

ASSESSMENT AND PLAN

1. Acute respiratory failure, obtunded, encephalopathic, unable to protect airway. This could possibly be secondary to oxycodone toxicity. This, however, was not prescribed and it is unclear exactly how the patient could have received this. A repeat toxicology screen, however, was positive. It certainly could be a real ingestion. It could be a false positive. His condition could also be sepsis secondary to urinary tract infection or possibly pneumonia. Sepsis can occasionally improve with Narcan as well temporarily and his episode was also complicated by hypotension. This could be systemic inflammatory response syndrome or sepsis. No obvious infiltrate. Clinically improved at this time. Long family discussion. We will attempt weaning parameters, hoping to extubate him and will follow sputum cultures carefully.

2. Pyuria. This could also be a urinary tract infection. The patient is on ceftriaxone. Follow cultures. IV hydration.

3. Systemic inflammatory response syndrome, present on admission, now with mild acute renal failure and dehydration. Aggressively hydrate.

4. Depression. Continue medications.

5. Candida of the skin, also suggested by sputum Gram's stain. Fluconazole and nystatin powder to skin folds. Multivitamin, zinc, vitamin C.

6. Gastroesophageal reflux. Continue Protonix.

7. Deep venous thrombosis prophylaxis. Lovenox subcutaneously 30 mg daily.

8. Hyperglycemia. Could be secondary to acute illness response. Check hemoglobin A1c. Sliding-scale insulin.

9. EKG showed atrial fibrillation, which is chronic. Rate controlled. Continue aspirin for cerebrovascular accident prophylaxis. Consider checking an echocardiogram.

10. Antihypertensives. Hold tonight in a setting of hypotension.

UNABLE TO OBTAIN HISTORY DUE TO: pt's mental status MS

HPI

chief complaint: decreased mental status / confusion
low blood sugar / diabetic fever

onset / duration: tonight
per son; normal at dinner
upon waking cannot confirm onset
gone now better continues in ED more than 3 hours
gradual-onset / sudden-onset / intermittent / constant

character of altered mental status:
disoriented / confused / combative / agitated / trouble concentrating
unresponsive / seizure activity / decreased responsiveness

context:
found unresponsive / unknown duration
by nursing home staff bystander family:
dextrostick PTA (250) given D50 / Narcan PTA
good / marginal / no response
recent / heavy alcohol intake (beer / wine / liquor)
last drink:
drug abuse / overdose
trauma head injury
infection / other ill contacts unknown

baseline
Cognitive: alert, oriented x3 / alert but disoriented / alert but confused / poor alertness / memory loss
Gait: walks w/o assistance / uses a cane / walker / walks only w/ assistance / stands for transfers / unable to walk

associated symptoms:
fever / chills / sweaty
chest pain
neck / back pain
hurts to breathe / short of breath
headache
new weakness RUE RLE LUE LLE R/L facial general (diffuse)
altered sensation RUE RLE LUE LLE R/L facial
falling injury
decreased ability to stand / walk weak difficult off balance cannot walk cannot stand
fainting / dizzy
involuntary seizure / movements

Similar symptoms previously

Recently seen / treated by doctor

ROS - when awake, felt well at bed time

CONST NO HA/N/V
recent illness
EYES / ENT
vision change / problems

NIGHTSHIFT RADIOLOGY

*** Preliminary Report ***

Gray's Harbor Community Hosptial

CT HEAD

Patient: 2 - Healthcare Information Re...

MR #: M0102440

Exam Date: 02/09/2011

Radiologist: Brad Tipler, M.D.

Physician contact number regarding this report:

Voice (866) 832-5834

Physician number listed is to only be used on the date of this report – for all other times or issues, please call the main business number at (866) 316-8900

HISTORY: Decreased level of consciousness.

HEAD CT: The bones and extracranial structures are unremarkable. Within the cranium no extra-axial mass or fluid collection is seen. There is no acute hemorrhage.

The ventricles and sulci are prominent. The white matter shows inhomogeneous areas of decreased density. There is no focal mass effect or focal lesion.

IMPRESSION: Moderate atrophy and white matter findings consistent with chronic changes. No acute intracranial process demonstrated.

This report was transmitted to the emergency room at 2/9/2011 2:50:00 AM PST.

***This report constitutes a preliminary interpretation only. Non acute findings felt to be unrelated to the clinical presentation may not be discussed in this report. The study will be interpreted and a final report will be generated by the local Radiologist the following shift.

***INTERPRETING RADIOLOGIST: If there is a significant discrepancy between this report and your interpretation please *fill out and send the NightShift Discrepancy Form.*

02/10/11

ACTIONS

TIME		INIT
OA	cardiac monitor / ★ pulse oximeter O_2 4 L via NC / mask / NRB	
	Accu-Chek	
	emesis / incontinence care	
0045	ready for Dr eval. notified doctor / seen by Dr	
	restraints see documentation Byrd	
	social worker intervention limited extended	

IV STARTS lock / IV fluid

TIME	#	site	gauge	attempts	complications	INIT
PTA	1	(R) H	18			EMS
0345	2	(R) AC	20			

IV / MEDICATION INFUSION RECORD

Start Time	Solution / Med	Type / Pump	Rate ml / hr	Stop Time	Amount Infused	INIT
PTA	NS TKO	KVO			1000	EMS
	Response: no change improved					
0145	A'd IVF to w/o Bolus					
	Response: no change improved					
0220	Norcuron drip ✓ 25mg (0.4 mg/ml) in 24 hrs of NS					
	Response: no change improved					

(Charted on page 2 cont'd)

MEDICATIONS

★ ASA / beta-blockers / antibiotics / thrombolytics / pneumovax

Time	Medication	Dose	Route	Site	INIT
0148	Norcuron	0.4mg	IV	—	
0150	Response: no change improved				
0255	Norcuron	0.2mg	IV	—	
0311	Response: no change improved				
0315	Ceftriaxone 1gm IV Piggyback				
	Response: no change improved RAC				
0330	Norcuron	0.4mg	IV		
	Response: no change improved from new bag				
0535	Norcuron	0.4mg	IV		
	Response: no change improved from new bag				

immunizations / OTC / prescription PO / SL / TOPICAL / parenteral meds / blood products / "crit care med"

PROCEDURES

TIME		INIT
0030	12-lead EKG performed notified Byrd	
0045	Foley 14 Fr. 150 mL return	
	NG 18 fr. mL return coffee ground	
	placement confirmed to suction low / intermittent	
PTA	lab drawn / sent by ED tech / nurse / lab	EMS
	clean catch / urine pregnancy test results back	
	★ ABG drawn by nurse / MD / RT	
0040	★ blood Cx drawn 0050 x2	
	awaiting physician review	
0055	to Xray single multi w/ monitor / nurse / O_2 / tech	
	return to room	
0210	to CT w/ monitor / nurse O_2 tech	
0225	return to room	
	★ to cath lab for PCI / other	

VITAL SIGNS

RE: Unknown Respondent
Case No. 2011-153821MD

Dear Mr. & Mrs. Foulds:

Thank you for your recent letter in which you express concerns regarding medical care provided by an Unknown Respondent. Your complaint has been assigned case number 2011-153821MD.

Your complaint will be investigated to determine if a violation of the Uniform Disciplinary Act, RCW 18.130.180, Unprofessional Conduct, has occurred. If you have any additional information pertaining to your complaint, please forward it along with a copy of this letter to me at the address listed below. Please understand that you may not hear from us during the investigation. If we need additional information from you, one of the Commission's investigators will contact you.

Enclosed for your information is the brochure, *What Happens Next?* along with a copy of RCW 18.130.180, the statute that identifies Unprofessional Conduct. Once the investigation is complete, a panel of the Medical Quality Assurance Commission will review the facts of the case and make a decision. You will be notified in writing of the decision.

Thank you for bringing your concerns to the attention of the Medical Quality Assurance Commission. If you have any questions or need additional information, please call me at 360-236-2770.

Sincerely,

James H. Smith, Chief Investigator
Medical Quality Assurance Commission

Dear Mr. & Mrs. Foulds:

Washington state law, RCW 43.70.075, pertains to the "Whistleblower Law" which requires that the identity of a complainant/whistleblower who complains in good faith to the Department of Health about improper quality of care by a health care provider shall be kept confidential. In some instances, particularly in your case, where you are the consumer of care complaining against a provider, an investigation cannot proceed without disclosure of your identity to the particular provider. This is so the provider can respond appropriately to the allegations of your complaint and provide records specific to your complaint.

This investigation and/or action is contingent upon the disclosure of your identity to the provider. Should you desire this investigation to proceed, your voluntary authorization in the form of an Authorization to Release Complainant's Name will be necessary. I have enclosed this form for your signature, along with a postage paid envelope for its return. Once your waiver is received, your identity will be released solely for the purposes of investigation and adjudication as necessary. Your identity will be protected in all other instances and will not be released in response to public disclosure requests. ***Your signed waiver is due back by no later than March 10, 2011.***

If you have any questions, please contact me at (360) 236-2770.

Thank you for your cooperation.

Sincerely,

James H. Smith, Chief Investigator

AUTHORIZATION TO RELEASE COMPLAINANT'S NAME PURSUANT TO RCW 43.70.075

RCW 43.70.075 provides In part: "The Identity of a whistleblower who complains, in good faith, to the Department of Health about the improper quality of care by a health care provider, or in a health care facility, ... shall remain confidential."

I understand that my identity is confidential pursuant to RCW 43.70.075, unless waived.

By signing this document, I waive my right to confidentiality and authorize the Department of Health to release my identity to **UNKNOWN** respondent, and to other persons who are reasonably necessary to the investigation, and for use in any subsequent administrative proceeding regarding my complaint. I understand that my identity will not be released for any other purpose.

APPROVAL OF CONFIDENTIALITY WAIVER

For the sole purpose of investigating my complaint and pursuing disciplinary/adverse action proceedings, I hereby waive confidentiality and consent to the release of my identity.

Signature:_____ **Printed name:** _____
Date:_____ Please include middle initial
Home Phone:_____ **Date of Birth:** _____
Day Phone:_____ ***PLEASE RETURN NO LATER THAN March 10, 2011***

DENIAL OF CONFIDENTIALITY WAIVER

I refuse to waive my right to confidentiality and deny consent to the release of my identity. I understand this denial may impair the Department of Health's ability to pursue investigation of this matter and any disciplinary/adverse actions.

RE: MONTESANO HEALTH & REHAB CENTER

Dear VALERIE FOULDS:

Thank you for contacting the Complaint Resolution Unit (CRU) hotline in Residential Care Services (RCS) with your concerns about the facility/provider referenced above. RCS is part of the Department of Social & Health Services (DSHS), and is responsible for the licensing and/or certification of supported living, nursing homes, boarding homes, adult family homes, and institutions for persons with mental retardation in Washington State. RCS investigates complaints in all of these settings.

To help you better understand what you can expect from us, we've enclosed a fact sheet about RCS Complaint Investigations.

Staff in the CRU enters the information from your message, and any follow-up conversations about that message, onto an intake form. Registered nurses that work in the CRU review the intake and determine how quickly RCS needs to respond with an investigation. After this priority is established, CRU sends the intake to a regional field office. This office is where the complaint investigators are physically located, and those investigators will be the ones to go to the facility to look into the potential regulatory issues that are part of your report.

If you left your name and telephone number with the CRU when you called, and gave permission to be contacted, the regional field investigator will also call you to review your concerns before going to the facility or home.

The control number assigned to your concerns is 11-02-04370.

RE: WA State Medical Quality Assurance Commission Investigation/
File # 2010-151650MD

Dear Medical Record Technician:

This letter identifies documentation needed in the investigation regarding the care of 2 - Healthcare Information Readily ... . This is a request for medical records. Your input will be of great assistance in the conduct of this investigation.

The Medical Quality Assurance Commission is the agency within the State government with legislated authority to assure the delivery of safe health care. Under provision of RCW 18.130.050 and RCW 18.130.160 of the Uniform Disciplinary Act, the Medical Quality Assurance Commission is empowered to investigate all allegations and complaints to determine whether such allegations are substantiated and to take disciplinary or corrective action If It is warranted.

Be advised that this is a preliminary investigation and no charges against the licensee have been issued In connection with this investigation.

The Health Care Information Act, RCW 70.02.050 (2) (a) authorizes and requires a health care provider to disclose health care information concerning a patient(s) without the patient's authorization when needed to determine compliance with state licensure regulations and laws, or when needed to protect the public health. Pursuant to the health care Information act, compulsory process (subpoena) Is no longer required to obtain health care information.

Under provisions of the above laws, you are requested to provide the following: The 02/08/11 ER report, the H&P/Discharge reports for 2 - Healthcare Information Readily Identifiabl... (DOB 2 - Healthcar...) 02/08/11-02/14/11 admission, all urine toxicology reports.

Please send the requested documentation to the address below or fax it to (360) 236-2795 **within 14 days**. Note: If there is a charge for the copying of the records, please Include your **federal tax identification number** on your billing statement. If copying costs will exceed $100.00, please advise before copying. ATTN: Connie Pyles, Health Care Investigator. If you have any questions concerning this request, please contact me at (360) 236-2776. Thank you for your cooperation.

Sincerely,

Connie Pyles
Health Care Investigator
Medical Quality Assurance Commission
Department of Health

RE: WA State Medical Quallly Assurance Commission Investigation/
File # 2010-161650MD

Dear Medical Record Technician:

This letter identifies documentation needed in the investigation regarding the care of 2 - Healthcare Information Readily I... This is a request for medical records. Your input will be of great assistance in the conduct of this investigation.

The Medical Quality Assurance Commission is the agency within the State government with legislated authority to assure the delivery of safe health care. Under provision of RCW 18.130.050 and RCW 18.130.160 of the Uniform Disciplinary Act, the Medical Quality Assurance Commission is empowered to investigate all allegations and complaints to determine whether such allegations are substantiated and to take disciplinary or corrective action if it is warranted.

Be advised that this is a preliminary investigation and no charges against the licensee have been issued in connection with this investigation.

The Health Care Information Act, RCW 70.02.050 (2) (a) authorizes and requires a health care provider to disclose health care information concerning a patient(s) without the patient's authorization when needed to determine compliance with state licensure regulations and laws, or when needed to protect the public health. Pursuant to the health care information act, compulsory process (subpoena) is no longer required to obtain health care information.

GH13321317

Under provisions of the above laws, you are requested to provide the following: The 02/08/11 ER report, the H&P/Discharge reports for 2 - Healthcare Information Readily Identifiab... (DOB 2 - Healthcar...) 02/08/11-02/14/11 admission, all urine toxicology reports.

Please send the requested documentation to the address below or fax it to (360) 236-2795 within 14 days. Note: If there is a charge for the copying of the records, please include your federal tax identification number on your billing statement. If copying costs will exceed $100.00, please advise before copying. ATTN: Connie Pyles, Health Care Investigator. If you have any questions concerning this request, please contact me at (360) 236-2776. Thank you for your cooperation.

Sincerely,

Connie Pyles
